

Keyboard Support Installation Instructions for Benches with Top Support Rails and 1" minimum top thickness

The Keyboard Support can be installed directly to the underside of work surface. For maximum adjustment range use these instructions to install the Keyboard Support to the Top Support Rails.

Step:

1. Insert the Support Plate (1) into the Top Support Rail (2) with the inserts facing up and toward the center of the bench.

If the Top Support Rail (2) is not an open channel as shown, use the Support Plate (1) as a template only. Center the plate on the rail with inserts toward the center of the bench. Mark the five hole locations and drill using a 5/32" bit.

2. Temporarily fasten the Track (3) to the Support Plate (1) or Rail (2) using two 10-24 x 1/2" screws (7) into the threaded inserts.

The screws will self-tap when mounting directly to the drilled rail holes

3. Use 2-1/2" long screw (8) to mark three hole locations. Use a spacer (4) as a guide. Position the spacer as shown between the bottom of work-surface and track (3). Tap the screw with a hammer to mark the bottom of the work-surface.
4. Remove the Track (3) and drill pilot holes at the marked locations 1/2 to 3/4" deep using a 1/8" bit.
5. Fasten the Track (3), Spacers (4) and Bumper (5) with the screws (7 & 8) as shown.
6. Slide the Keyboard Support Mechanism into the Track and fasten the Stop (6) to the Support Plate (1) or Rail (2) using self-taping screws (7).
